

BOUNTY SPECIFICATION: REPOSITORY DUMP TOOL

Bounty Amount: €100 (Bitcoin)

Objective

Create a simple, reliable software tool or pipeline that completely dumps and saves all data, discussions, and attached media from a GitHub repository back into the repository. The tool must be easily executable from a mobile phone (e.g., via a GitHub Actions workflow or a simple interface) or standard pipeline.

Core Requirements

- **Complete Data Extraction Across 3 Main Areas:**
 - **Issues:** All open and closed issues, full text, and complete comment threads.
 - **Pull Requests (PRs):** All open and closed PRs, full text, and complete comment threads.
 - **Releases:** All release notes, text, tags, and release artifacts.
- **Media & Artifact Preservation:**
 - Automatically download and save all images, files, code artifacts, and attachments uploaded inside issues, PR comments, and releases.
- **Usability & Storage:**
 - **Direct Repo Dump:** Saves all extracted data and assets directly into the target repository.
 - **Mobile-friendly:** Must be triggerable directly from a mobile device without requiring a local desktop environment.
 - **Non-technical operation:** Simple trigger mechanism for team members.

Acceptance Criteria

The bounty of €100 will be awarded upon demonstrating a working execution on a target repository that successfully exports the complete history, comment threads, releases, and associated file attachments directly into the repo.
