

Anchor Crow: A Thesis on the Persona — Cultural, Mythological, and Methodological Foundations

TL;DR

- **Anchor Crow is a coherent, genuinely novel persona precisely because it fuses four independently deep traditions into one figure:** the corvid as trickster/messenger/psychopomp (myth), the scientifically documented crow as a near-primate intelligence grounded in real field research (science), the "kawaii-by-day/rage-by-night" dual-mascot archetype borrowed and transformed from Sanrio's *Aggretsuko* (pop-culture critique), and the open-source, human-in-the-loop, anti-capture ethos signaled by the "Provo 42" name (countercultural politics). The kanji swap from 烈 (rage) to 自由 (freedom) is the conceptual keystone that turns private catharsis into a public thesis about autonomy.

- **The character's meaning shifts the source archetype's center of gravity:** where Retsuko rages to survive an oppressive system (catharsis as coping), Anchor Crow rages toward liberation (catharsis as politics). This is a pointed inversion — the *Japan Forum* scholars who coined the "transgressive rage" reading argue that in *Aggretsuko* itself "any potential paths to freedom or rebellion [are] hampered by a corporate system that reabsorbs transgressive behavior and sells it back to customers." Anchor Crow's whole design refuses that reabsorption.
- **On naming: "Anchor" is grounded and real (a field-identified crow) but collision-prone and semantically heavy; "Anchorow" is the distinctive, defensible, AI-"mangle"-born coinage with the strongest novelty and lowest collision risk; "Anchor Crow" is the legible public-facing compromise.** No major existing corvid mascot/trademark uses "Anchorow," which is the character's strongest identity asset.

Key Findings

1. **Corvids are the rare mythic animal whose symbolism is earned by observable behavior.**
Across Norse, Celtic, Japanese, Greek, and Pacific Northwest traditions, crows and ravens are simultaneously intellect, memory, prophecy, death,

creation, and trickery — a paradoxical range that maps onto a character built on a public/private, compliant/raging duality.

2. **Real corvid science supplies the character's spine.** Facial recognition of individual humans, multi-year grudge-holding, tool manufacture, future planning rivaling great apes, and primate-like forebrain neuron counts make the crow the ideal vessel for a character about memory, watchfulness, autonomy, and intelligence hiding behind a "bird-brained" stereotype.
3. **Aggretsuko is the direct archetypal parent, and the transformation away from it is substantive, not cosmetic.** Retsuko dramatizes the *honne/tatemae* (private/public) split of Japanese corporate life; swapping red panda → corvid and 烈 (rage) → 自由 (freedom) re-poses the same structure as a thesis about liberty rather than personal venting.
4. **The Provo lineage gives the "freedom" thesis a concrete political ancestry.** The 1960s Dutch Provo movement fused play, absurdist "happenings," and anti-authoritarian provocation — a template for treating creative play itself as resistance, and for the "42" in Provo 42.
5. **Open-source/distributed persona theory (Luther Blissett, Anonymous, egregores, masked musicians) situates the human-in-the-loop**

method. The novelty is not anonymity per se but a *named, individually-grounded, AI-co-created but human-conducted* persona archived under open licenses — an "open reputation" with a single human "Maestro" rather than a leaderless multitude.

6. IP posture is defensible if the transformation

stays substantive. Anchor Crow borrows an *archetype* (cute mascot with a rage alter-ego), not Retsuko's protected expression; the species change, name change, kanji change, and freedom thesis are exactly the kind of transformative reworking that separates homage from infringement. AI-generated art raises separate copyrightability limits that the human-in-the-loop method partly mitigates.

Details

1. Corvid symbolism and mythology: the boundary-crosser

No animal carries a more productive contradiction than the corvid, and that contradiction is the character's mythic license.

Norse. Odin's two ravens, Huginn ("thought," from *hugr*) and Muninn ("memory/mind," from *munr*), fly over the world each day and return to whisper what

they have seen, making Odin the "raven-god" (*Grímnismál*, retold in Snorri's *Gylfaginning*, ch. 38).

Scholars note that the two names overlap in meaning and that the ravens function as extensions of Odin's own mind — thought and memory externalized. For a character grounded in a *real remembered individual* crow and in memory-based field research, Huginn/Muninn is the ideal mythic anchor: the corvid as cognition itself.

Celtic. The Morrígan ("Phantom Queen"/"Great Queen"), often a triple goddess (Badb, Macha, Nemain), shapeshifts into a crow or raven over battlefields, choosing who lives and dies, and famously perches on the dying Cú Chulainn's shoulder to signal his death. She embodies liminality — moving between maiden and hag, human and bird, this world and the Otherworld — and sovereignty. She models the corvid as fate, transformation, and feminine power/rage.

Japanese. Yatagarasu, the three-legged crow, is a divine messenger sent by the sun goddess Amaterasu to guide Emperor Jimmu to Yamato (recorded in the *Kojiki* and *Nihon Shoki*, 720 AD). It symbolizes guidance, divine will, and the sun; the three legs are variously read as heaven/earth/humanity or wisdom/benevolence/valor, and the crow is also "a mark of rebirth and rejuvenation." [Wikipedia](#) Given the character's Japanese-corporate-mascot parentage,

Yatagarasu supplies a specifically Japanese, benevolent, guiding corvid register — the counterweight to the Western death-omen.

Pacific Northwest. Among the Tlingit, Haida, and Tsimshian, Raven is both creator and trickster — stealing the sun/light for humanity, both selfish and generous, foolish and clever. Crucially, these traditions treat Raven's rule-breaking as *necessary for growth* rather than dangerous, which is precisely the frame a "freedom" thesis needs: transgression as creative liberation.

Psychopomp and omen. Across traditions the corvid guides souls between life and death (Norse valkyries-as-crows carrying the slain to Valhalla; the Morrígan; Greek associations). In Greek myth (Ovid), Apollo's white raven is turned black for delivering unwelcome truth — the corvid as the truth-teller punished for honesty. A scholarly synthesis ("Living with the Trickster," reviewed in a peer-reviewed venue) argues humans and crows have undergone a kind of cultural coevolution, with "cleverness" the one attribute all cultures agree on.

Thesis use: the corvid lets Anchor Crow be, simultaneously and without contradiction, intelligence, memory, messenger, trickster, boundary-crosser, and harbinger of change — a mythic profile

that already contains the day/night, compliant/raging duality.

2. Corvid cognition: the science that grounds the myth

The character's power is that the myth is *literally true* in the lab and field.

- **Facial recognition and grudges.** John Marzluff's University of Washington team showed wild American crows (*Corvus brachyrhynchos*) learn a "dangerous" human face from a single trapping event; the 2009 *Animal Behaviour* study documented recognition "for at least 2.7 years," and the 2012 PNAS brain-imaging work (Marzluff et al.) showed face recognition activates emotional/threat circuitry (an amygdala-equivalent). The famous "caveman mask" experiment ran, in Marzluff's own account (Yale University Press, 2025), until a final masked walk in "September 2023, about 17 and a half years after the original captures"; over twelve years "roughly four of every ten crows I encountered scolded me... twice the number that might scold me when I wore the [neutral] Cheney mask" — evidence of long-term social memory spreading to birds that never witnessed the original trapping (cultural transmission of a grudge).

- **Tool manufacture.** Betty, a New Caledonian crow at Oxford, bent straight garden wire into a hook to retrieve food (Weir, Chappell & Kacelnik, *Science*, 2002); later field work (Christian Rutz et al., 2016) showed hook-bending is part of the species' natural repertoire, reframing the feat as drawing on species-typical behavior. Von Bayern, Danel, Auersperg, Mioduszevska & Kacelnik (*Scientific Reports*, 2018, 8:15676) showed that of 8 naïve crows, "four spontaneously combined elements to make functional tools," with one bird (Mango) making 3- and 4-piece compound tools — an ability "so far observed only in humans and great apes."
- **Causal reasoning.** Jelbert, Taylor, Cheke, Clayton & Gray (*PLOS ONE*, 2014, 9(3):e92895) found New Caledonian crows solve Aesop's-fable water-displacement tasks with "a sophisticated, but incomplete, understanding of the causal properties of displacement, rivalling that of 5–7 year old children."
- **Mental templates.** Jelbert, Hosking, Taylor & Gray (*Scientific Reports*, 2018, 8:8956) showed crows reproduce a remembered tool-size template even when it is absent — a candidate mechanism for cultural transmission of tool designs.
- **Future planning and self-control.** Kabadayi & Osvath (Lund University, *Science*, 2017, 357:202–

204) showed five ravens plan for future tool-use and bartering, "consistently pick[ing] the right tool... even when the box was missing — for up to 17 hours," with self-control in forgoing immediate treats; "the birds performed at least as well as apes and small children." (Note the associative-learning critique, e.g. Lind, *R. Soc. open sci.* 2018, 5:180778 — worth acknowledging.)

- **Geometry.** Schmidbauer, Hahn & Nieder (University of Tübingen, *Science Advances*, 2025) reported carrion crows recognize geometric regularity (right angles, parallelism, symmetry), *outperforming baboons* on the "regularity effect" — though a perceptual/CNN counter-explanation has been published.
- **Neural basis.** Olkowicz et al. (Charles University, Prague, *PNAS*, 2016, doi:10.1073/pnas.1517131113) found songbird/parrot pallia "reach twice the amount of neurons" of same-mass primate brains; "the raven or the kea have ~1.2 billion pallial neurons, more than in the pallium of a capuchin monkey" — a proposed substrate for primate-like cognition via a convergently evolved forebrain.
- **Flight Initiation Distance (FID).** FID — the distance at which an animal flees an approaching human — is a standard measure of fearfulness/risk-tolerance; urban corvids show systematically

shorter FIDs than rural ones, and corvids serve as model species for "synanthropization" (adaptation to human presence). The creator's own FID field research on the individually-identified crow "Anchor" places the persona at the exact scientific frontier where wild autonomy negotiates with human proximity — a literalization of the character's freedom-vs-capture theme.

- **Play.** Bernd Heinrich documented ravens repeatedly sliding down snowy roofs and rolling down snowbanks for no utilitarian purpose ("Play in Common Ravens," 1998); recent work documents object play (hanging upside-down, tug-of-war, aerial drop-and-catch). Play as intrinsic, autonomous, non-instrumental behavior is the ethological root of the "play = freedom" argument the Provo lineage also makes.

Thesis use: the crow is not a whimsical mascot animal; it is a memory-holding, face-reading, tool-making, future-planning, playing intelligence. Every mythic claim about corvid cleverness is scientifically underwritten, which lets the thesis argue that Anchor Crow is a character where myth and empiricism *converge* rather than compete.

3. The dual-mascot / kawaii-vs-rage archetype

Aggretsuko (Sanrio, shorts from 2016; Netflix series 2018–2023) follows Retsuko, a 25-year-old red panda

accountant at a Tokyo firm who endures a misogynistic pig boss and daily corporate humiliation by day and screams death-metal karaoke by night. The core gag — Sanrio-cute design colliding with death-metal rage — is, as multiple critics argue, sharp social commentary on Japanese corporate culture: overwork, power-harassment, the gendered wage gap and management gap, and the *honne/tatemae* (private-truth/public-face) divide.

Scholarship frames this precisely. Robertson, Hambleton & Hiramoto's peer-reviewed article "The beginning of despair: aggressive Retsuko and the Sanrioization of women's 'transgressive rage'" (*Japan Forum* 36(4):385–411, 2024) analyzes Retsuko as Sanrio's production of "kawaii catharsis" and "transgressive rage," and argues that anger has historically been coded as "all-male terrain." Their central claim is that Retsuko is permitted to express rage *only in private, before returning to work* — and that "any potential paths to freedom or rebellion [are] hampered by a corporate system that reabsorbs transgressive behavior and sells it back to customers." The system grants catharsis as a pressure-release valve, not as liberation. Her name encodes this: 烈 (*retsu*, "fierce/violent/rage") + 子 (*ko*, "child") = "child of rage," and the 烈 kanji literally appears on her forehead in rage mode.

The broader tradition. The "cute exterior, dark/rage interior" pairing is a recognized device (Sanrio itself has leaned countercultural with the depressed egg Gudetama). The corporate-mascot phenomenon in Japan — *yuru-kyara* ("loose/laid-back characters"), a term coined by illustrator Jun Miura — is a genuine socio-cultural force: mascots like Kumamon (Kumamoto Prefecture, 2010) generate enormous publicity and even provide communal healing after disasters (Kumamon's post-earthquake visits in 2016), functioning almost as modern folk deities (one study links Kumamon to the Jizō bodhisattva). The mascot is thus a figure of manufactured, sanctioned, collectively-owned cuteness — exactly the compliant "day" self against which Anchor Crow's "night" self rebels.

The transformation. By swapping 烈 → 自由 (*jiyū*, "freedom/liberty"), the creator changes what the rage is *for*. 自由 is itself a loaded word: originally a Buddhist/Chinese term meaning roughly "from oneself / following oneself," it was repurposed in the 1860s by Fukuzawa Yukichi (in *Seiyō Jijō*, 1866) to translate the Western "freedom/liberty." So the kanji already means "arising from oneself" — autonomy, self-origination — which is thematically perfect for an open-source, *self-created* character. Retsuko's forehead brands her *emotion*; Anchor Crow's forehead brands its *politics*. Where Retsuko's rage is

reabsorbed by the corporate machine, 自由 explicitly names the exit the source character is denied.

4. The Provo movement and the politics of play

"Provo 42" invokes the Dutch Provo movement (founded May 1965 by anti-smoking performance-artist Robert Jasper Grootveld and anarchist Roel van Duijn, with Rob Stolk; disbanded May 1967). "Provo" derives from *provoceren* (to provoke); the movement used non-violent, absurdist "happenings" to bait authorities into overreaction, exposing the violence latent in the establishment. Its most famous initiatives were the "White Plans," above all the White Bicycle Plan (Luud Schimmelpennink) — free communal white bicycles as an anti-car, anti-property, ecological provocation. Inspired as much by Dada and Herbert Marcuse as by classical anarchism, Provo treated *play* as a serious political method; it won a seat on Amsterdam's city council in 1967 and its imagery reached global audiences (John Lennon and Yoko Ono used white bicycles during their 1969 Amsterdam bed-in).

Notably, the Attogram Project's GitHub org lists Amsterdam, NL as its base — tying the "Provo" reference to a real geographic and countercultural lineage rather than mere allusion, and its repository names ("dada-vibing," "attogram-after-dark," "rock-

street") echo the Dada/happening register. Situationism is the adjacent context: the *détournement* (creative rerouting) of existing cultural material toward liberatory ends is essentially what the kanji-swap and the Retsuko-to-corvid transformation perform.

Thesis use: Provo supplies the missing political grammar. It explains why "freedom" (自由) rather than "rage" (烈): the character is not merely blowing off steam but enacting a playful, provocative refusal of capture. Play-as-resistance links the raven sliding down a snowbank (science), Raven stealing the sun (myth), the white bicycle (politics), and the death-metal karaoke (pop culture) into one argument.

5. Open-source / distributed personas and character theory

Anchor Crow belongs to a lineage of characters that are *bigger than any single author*:

- **Luther Blissett** (1994–1999): a "multiple-use name" or "open reputation" adopted by hundreds of artists/activists across Europe, named (for reasons that remain unknown) after a Black British footballer, used to stage media pranks and build a shared folk-hero mythos ("mythopoesis"). Theorist Marco Deseriis calls these "improper names," distinguishing decentralized "multiple-use

names" from centralized "collective pseudonyms." The Blissett project ritually "committed seppuku" in 1999; some members became the writers' collective Wu Ming ("anonymous" in Mandarin), rejecting the celebrity-author cult.

- **Anonymous / the Guy Fawkes mask:** the *V for Vendetta*-derived mask as a symbol of leaderless collective identity and anti-authoritarian resistance — the face that belongs to everyone and no one.
- **Egregores and tulpas:** Western-esoteric/Tibetan-derived concepts of thoughtforms that gain autonomy from collective (egregore) or individual (tulpa) belief — a useful vocabulary for a character sustained by distributed participation, with modern internet analogues (Slender Man, Loab).
- **Masked musician personas:** Daft Punk, Gorillaz (Damon Albarn's virtual band with full character backstories — 2-D, Murdoc, Russel, Noodle), MF DOOM (the villain mask and multiple alter-egos — King Geedorah, Viktor Vaughn), Deadmau5, Ghost (Tobias Forge's Papa Emeritus and Nameless Ghoulies, whose identity was revealed via lawsuit but survived because it was always understood as theatre), and Sleep Token (the anonymous "Vessel," anonymity as living mythology requiring audience participation since 2016). These show that a mask/persona *concentrates* archetype and

redirects attention from the person to the work — as one analysis put it, "you can worship an archetype," not someone you've seen eating breakfast.

What makes the human-in-the-loop AI persona distinct. Anchor Crow differs from all of these on one axis: it is *individually grounded* (a real, named crow), *AI-co-created* (born partly from a language model's "mangle" of "Anchor" into "Anchorow"), and *human-conducted* (a single "Maestro" coordinating multiple AI models), yet *open-licensed and archived* (MIT/CC-BY/AAL, Zenodo DOIs, anti-capture foundation governance). It is neither a leaderless multitude (Anonymous) nor a concealed single genius (MF DOOM) but a *transparent, documented, reproducible* collaboration between one human and several machines. The FOUND masked-popstar persona in the same ecosystem confirms this is a deliberate practice, not a one-off.

Thesis use: the open-source method is not incidental packaging; it is the *enactment* of the freedom thesis. A character about autonomy and anti-capture is itself released under licenses and governance designed to prevent capture. Form and content coincide — and this is exactly the reabsorption-by-the-market that *Aggretsuko* scholars say Retsuko cannot escape but Anchor Crow is engineered to.

6. Provenance and IP: homage vs. infringement, and AI authorship

Two distinct questions matter here (this is cultural/practical analysis, not legal advice).

(a) Derivation from Retsuko. US law protects a work's specific *expression*, not its *ideas* or archetypes. The transformative-use doctrine (Campbell v. Acuff-Rose, 1994; refined and narrowed in Andy Warhol Foundation v. Goldsmith, 2023) asks whether a new work adds new meaning/message and whether it harms the original's market. Copying an *archetype* ("a cute mascot with a secret rage/metal alter-ego") is far safer than copying protected expression (Retsuko's specific design, name, red-panda look, 烈 kanji styling, storylines). Anchor Crow changes the species (red panda → corvid), the name, the kanji (烈 → 自由), the medium, and the thesis (catharsis → freedom). That is substantive transformation. The caution: *Dr. Seuss v. ComicMix* ("Oh, the Places You'll Boldly Go!") shows courts scrutinize "mash-ups" that occupy a market the original owner might license, and Sanrio is a litigious, licensing-driven company. The safe posture is to make the character legibly *its own* — never a "corvid Retsuko" in marketing, always "Anchor Crow," with the *Aggretsuko* debt acknowledged as archetypal influence rather than reproduced as costume.

(b) AI-generated art and copyright. The US Copyright Office's 2025 report (Part 2, issued January 29, 2025) holds that human authorship is a bedrock requirement: purely AI-generated output (including characters generated wholly from prompts) is not copyrightable, but works where a human exercises sufficient creative control, selection, arrangement, or editing *are* protectable in their human-authored elements. The human-in-the-loop "Maestro" model — where a human conceives, directs, selects, and arranges AI outputs — is precisely the configuration most likely to secure protection for the human-authored contributions, though character copyright for AI-originated characters remains legally unsettled (see Davis Wright Tremaine's 2026 analysis of "the character without an author").

Thesis use: the project's licensing/archival choices are not just ethical branding; they are a pragmatic response to a genuine legal gray zone. Openly documenting human authorship (the Maestro's decisions, the transformation story) both strengthens any copyright position *and* enacts the anti-capture ethos.

The naming question: Anchor vs. Anchorow vs. Anchor Crow

- **"Anchor"** is the most *grounded* (a real, field-identified individual crow) and semantically

richest: an anchor is stability, mooring, groundedness, weight — but also a maritime/nautical icon and, in media, the "anchor" who holds a broadcast together. Its weaknesses are collision and dilution: "Anchor" is a common brand word (dairy, banking, software, podcasting — e.g., Solana's Anchor framework; Spotify's former "Anchor" podcast platform), so it is essentially unownable as a standalone mark and semantically noisy.

- **"Anchorow"** is the *AI-mangle* coinage — the language model's mis-rendering of "Anchor" that the creator embraced as a "creative leapfrog." It is the single strongest identity asset: near-unique (no notable existing corvid character/mascot/trademark uses it), phonetically it contains both "Anchor" and "crow/-ow," and its very origin story (a human embracing a machine's productive error) *is* the human-in-the-loop thesis in miniature. Provenance and name become the same story.
- **"Anchor Crow"** is the *legible public compromise*: it states the species, keeps the grounded real-crow reference, and is instantly parseable, at the cost of some distinctiveness (it reads as descriptive).

Existing corvid-character landscape (collision check). The fictional-corvid space is crowded — Heckle and Jeckle (Terrytoons magpies, 1946, still

licensed across CBS/Viacom), the Dumbo crows, Diablo (*Sleeping Beauty*), Jeremy (*The Secret of NIMH*), Teto (*Nausicaä*), Nevermore (*Skullgirls*), Murkrow/Honchkrow/Corviknight (Pokémon), and Poe's Raven — but *none* occupy "Anchor," "Anchorow," or "Anchor Crow." The mythic names (Huginn, Muninn, Yatagarasu, Morrígan, Badb) are free but heavily freighted.

What is genuinely novel

Synthesizing the above, Anchor Crow's novelty is not any single element (dual mascots, masked personas, corvid characters, and open-source collectives all exist) but the *specific stacking*:

1. A **real, individually-identified, scientifically-studied animal** as the ground truth (most fictional corvids are pure invention).
2. An **archetype transformed at the conceptual keystone** — the kanji swap 烈→自由 changes the *telos* of rage from coping to liberation, directly answering the "reabsorption" trap scholars identify in the source.
3. A **countercultural political lineage** (Provo, Amsterdam, situationist détournement) that most mascot-derived characters lack.
4. A **human-in-the-loop, multi-AI, open-licensed method** whose *form enacts its content*

(autonomy/anti-capture).

5. A **provenance story where an AI error ("Anchorow") became the creative seed** – a genuinely 2020s mode of authorship.

Recommendations

Naming (decide first, everything else follows):

- **Adopt a layered naming architecture.** Use **"Anchorow"** as the true proper name / wordmark (most distinctive, defensible, and provenance-rich), **"Anchor Crow"** as the descriptive public-facing explainer ("Anchorow, the Anchor Crow"), and reserve **"Anchor"** for the in-universe reference to the real field crow and intimate/short-form use. This captures groundedness, legibility, and distinctiveness at once.
- **Benchmark that would change this:** if a trademark/common-law search reveals an active "Anchorow" or confusingly similar mark in entertainment/music classes, fall back to "Anchor Crow" as primary. Run a formal search (USPTO, EUIPO, and Benelux BOIP given the Amsterdam base) before any commercial release.

Positioning the *Aggretsuko* debt:

- **Acknowledge the archetype openly in scholarly/artist-statement contexts; never**

reproduce protected expression in commercial ones. Frame Retsuko as *influence and interlocutor*, and foreground the transformation (species, kanji, thesis). Avoid marketing copy like "the corvid Retsuko."

- **Threshold:** if Sanrio-specific visual cues creep into the design (the specific rage-face corpse-paint makeup, red-panda morphology, 烈 styling), pull them back — those are expression, not archetype.

IP / provenance hygiene:

- **Document the human "Maestro" authorship trail** (concept, selection, arrangement, editing decisions) alongside the Zenodo DOIs. This both strengthens copyright posture under the 2025 Copyright Office framework and materializes the anti-capture ethos.
- **Keep the license stack (MIT / CC-BY / AAL) explicit on every artifact**, and state the foundation's anti-capture governance in the character bible.

Thesis authorship (for the eventual written thesis):

- **Structure the argument around the keystone claim:** the 烈→自由 swap converts a *symptom* (rage) into a *program* (freedom), and everything

else (corvid myth, corvid science, Provo, open-source method) radiates from that pivot.

- **Use the myth/science convergence as the thesis's signature move:** argue that Anchor Crow is unusual because its mythic attributes are empirically true, collapsing the usual gap between symbol and referent.
- **Treat the FID field research as the literal enactment of the theme** — the measured distance at which a wild, autonomous creature tolerates human approach *is* the freedom-vs-capture negotiation, made quantitative.

Caveats

- **Some sourcing on corvid symbolism is popular/commercial** (jewelry blogs, pagan sites) rather than peer-reviewed; the core mythological facts (Huginn/Muninn, Yatagarasu, the Morrígan, PNW Raven) are well-attested in scholarship, but specific symbolic "meanings" vary by source and should be treated as cultural interpretation, not fixed doctrine.
- **Two headline corvid-cognition findings are actively contested:** the 2017 raven future-planning study (associative-learning critique, e.g. Lind 2018) and the 2025 crow-geometry study (perceptual/CNN counter-explanation). Present

them as striking but debated. Note also that the 2018 compound-tool paper is in *Scientific Reports*, not *Nature*, as some secondary sources state.

- **The Attogram Project / Provo 42 / FOUND / "Anchorow" specifics rely on user-provided context and limited public footprint** (a GitHub org, "attogram," based in Amsterdam, "building open source projects since 2001," with repos including "attogram-after-dark," "rock-street," "dada-vibing," and human-agent-collaboration tools like "rock-talk" and "academic-vibing"). I could not independently verify all claims (exact licensing, the "Maestro" method, the FID research details, the specific "mangle" event) from public sources; the thesis should cite the project's own documentation for these.
- **IP analysis here is cultural and practical, not legal advice.** Sanrio actively enforces its IP, and AI-character copyright is unsettled; consult a qualified IP attorney before commercial exploitation.
- **The 自由/freedom framing carries a minor cross-current in Japanese internet culture** (the pejorative *hyōgen no jiyū senshi*, "freedom-of-expression warrior," discourse); this is unlikely to attach to the character but is worth awareness given the Japanese-language kanji choice.
